

ossFTP

The One Sightsolutions FTP Service provides a way to push a file, or the contents of a directory from your Niagara station file system to a PC running an FTP server.

The transfer can be scheduled to run regularly at set times if required, for instance in the case of needing to transfer a weekly report that is generated on the JACE.

Because the JACE initiates the FTP connection, there is no need to leave ports open on the JACE, meaning security is not compromised to achieve the file transfer.

Property Sheet

OssFtpService (Oss Ftp Service)
